AMENDMENT

Please replace all prior versions and listings of claims with the following listing of claims.

LISTING OF CLAIMS:

1. (Currently Amended) A computer-implemented system for providing service level

management in a network, wherein the network includes a plurality of network components,

and wherein a service operates on a subset of the plurality of network components, the service

having a state, the system comprising:

multiple monitoring agents [[to]] that each monitor a respective aspect of operation of

one or more of the network components, wherein each monitoring agent detects one or more

events relative to in the respective monitored aspect of operation and generates alarms an

alarm as a function of the one or more detected events; and

an alarm correlation agent that receives the generated alarms from the monitoring

agents, wherein the alarm correlation agent that determines a current state of the service

based on the received alarms originating from the subset of the plurality of network

components and, that issues one or more instructions to autonomously establish a desired

desirable state of the service when the current state of the service is undesirable.

2. (Original) The system of claim 1, wherein the monitoring agents comprise at least one

of:

an infrastructure monitoring agent to monitor operation of the network infrastructure;

a computer system monitoring agent to monitor operation of at least one computer

system on the network;

a network traffic monitoring agent to monitor traffic on the network;

an application monitoring agent to monitor operation of at least one application

operating on the network;

a trouble-ticketing agent to receive reports of problems by users with respect to

operation of the network;

a response time monitoring agent to monitor a response time of a communication on the network;

a device monitoring agent to monitor operation of a device on the network; and

a multicomponent monitoring agent comprising an aggregate of any of the above monitoring agents.

3. (Currently Amended) The system of claim 1, wherein the monitoring agents and the alarm correlation agent agents comprise reasoning agents.

4. (Original) The system of claim 3, wherein the reasoning agents comprise one or more of:

a rule-based reasoning agent;

a model-based reasoning agent;

a state-transition graph based reasoning agent;

a code book based reasoning agent; and

a case-based reasoning agent.

5. (**Currently Amended**) The system of claim 1, comprising:

an alarm repository to receive that receives the one or more generated alarms from the monitoring agents, wherein the alarm correlation agent reads analyzes the alarms in the alarm repository.

6. (Currently Amended) A computer-implemented system for providing service level management in a network, wherein the network includes a plurality of network components, and wherein a service operates on a subset of the plurality of network components, the service having a state, the system comprising:

a first monitoring agent that monitors a respective first aspect of operation of one or more of the network components, wherein the first monitoring agent detects detecting one or

more events relative to in the first monitored aspect of operation and generates alarms generating an alarm as a function of the one or more detected events;

a second monitoring agent that monitors a respective second aspect of operation of one or more of the network components, wherein the second aspect is different from the first aspect, and wherein the second monitoring agent detects detecting one or more events relative to in the second monitored aspect of operation and generates alarms generating an alarm as a function of the one or more detected events;

an alarm repository that receives the generated one or more alarms from each of the first and second monitoring agents; and

an alarm correlation agent that reads analyzes at least the one or more received alarms in the alarm repository, and that determines a current state of the service based on from the read one or more analyzed alarms that originate from the subset of the plurality of network components, wherein the alarm correlation agent is operative to issue, and issues one or more instructions to autonomously establish a desired desirable state of the service when the current state of the service is undesirable.

7-8. (Cancelled)

9. (Currently Amended) The system of claim 6, wherein the first and second monitoring agents comprise at least one or more of:

an infrastructure monitoring agent to monitor operation of the network infrastructure;

a computer system monitoring agent to monitor operation of at least one computer system on the network;

a network traffic monitoring agent to monitor traffic on the network;

an application monitoring agent to monitor operation of at least one application operating on the network;

a trouble-ticketing agent to receive reports of problems by users with respect to operation of the network;

a response time monitoring agent to monitor a response time of a communication on

the network;

a device monitoring agent to monitor operation of a device on the network; and

a multicomponent monitoring agent comprising an aggregate of any of the above

monitoring agents.

10. (Currently Amended) The system of claim 6, wherein the first and second monitoring

agents and the alarm correlation agent comprise reasoning agents, wherein the reasoning

agents comprise one or more of:

a rule-based reasoning agent;

a model-based reasoning agent;

a state-transition graph based reasoning agent;

a code book based reasoning agent; and

a case-based reasoning agent.

11. (Currently Amended) A computer-implemented system for providing service level

management in a network having at least one monitoring agent to monitor at least one aspect

of operation and to generate an alarm as a function of one or more detected events, wherein

the network includes a plurality of network components[[,]] and at least one monitoring agent

that monitors an aspect of operation of one or more of the network components, wherein the

monitoring agent detects events in the monitored aspect of operation and generates alarms as

a function of the detected events, and wherein a service operates on a subset of the plurality

of network components, the service having a state, the system comprising:

an alarm correlation agent that receives the generated alarms from the at least-one

monitoring agent, wherein the alarm correlation agent determines to determine a current

state of the service based on the received alarms originating from the subset of the plurality of

network components and that issues one or more instructions to autonomously establish a

desired desirable state of the service when the current state of the service is undesirable.

Application Serial No.: 09/578,156
Attorney Docket No.: 019287-0317293
Reply and Amendment Accompanying RCE

12. (Currently Amended) The system of claim 11, wherein the alarm correlation agent

comprises one or more of:

a rule-based reasoning agent;

a model-based reasoning agent;

a state-transition graph based reasoning agent;

a code book based reasoning agent; and

a case-based reasoning agent.

13. (Currently Amended) A computer-implemented method of for providing service level

management in a network, wherein the network includes a plurality of network components,

and wherein a service operates on a subset of the plurality of network components, the service

having a state, the method comprising:

monitoring at least one aspect or more aspects of operation of one or more of the

network and components;

detecting one or more events relative to of in the one or more aspects monitored

aspect of operation;

generating alarms an alarm for a respective aspect of network operation as a function

of the respective detected one or more events;

analyzing determining a relationship between the generated one or more alarms and

determining to determine a current state of the service as a function of the relationship

between the one or more alarms that originate from the subset of the plurality of network

components; and

issuing generating one or more instructions to autonomously establish a desired

<u>desirable</u> state of the service when the current state of the service is undesirable.

14. (Cancelled)

15. (Currently Amended) The method according to claim 13, wherein the monitored

aspects of operation include further-comprising monitoring at least one of:

Application Serial No.: 09/578,156
Attorney Docket No.: 019287-0317293
Reply and Amendment Accompanying RCE

operation of the network infrastructure;

operation of at least one computer system on the network;

traffic on the network;

operation of at least one application operating on the network; and

operation of a trouble-ticketing <u>agent</u> <u>process</u> that receives reports of problems by users with respect to operation of the network;

operation of a device on the network;

a response time of a communication on the network; and

an aggregate of any of the above aspects of operation.

16. (Currently Amended) The method of claim 13, wherein the generating the alarms includes an alarm comprises applying at least one of:

rule-based reasoning;

model-based reasoning;

state-transition graph based reasoning;

code book codebooks based reasoning; and

case-based reasoning.

17. (Currently Amended) The method of claim 13, wherein correlating analyzing the generated one or more alarms comprises includes applying at least one of:

rule-based reasoning;

model-based reasoning;

state-transition graph based reasoning;

code book codebooks based reasoning; and

case-based reasoning.

18. (Currently Amended) A computer-implemented method of <u>for</u> providing service level management in a network, wherein the network includes a plurality of network components,

and wherein a service operates on a subset of the plurality of network components, the service having a state, the method comprising:

monitoring a first aspect of operation of one or more of the network and components; detecting one or more events relative to in the first monitored aspect of network operation;

generating a first set of alarms as a function of the detected events in the first monitored aspect of operation;

monitoring a second aspect of operation of one or more of the network components, wherein the second aspect is different from the first aspect[[, and]];

detecting one or more events relative to in the second monitored aspect of network operation;

generating a first alarm as a function of the detected one or more events relative to the first aspect of network operation;

generating a second set of alarms alarm as a function of the detected one or more events relative-to in the second monitored aspect of network operation;

sending the generated first and second sets of alarms to an alarm repository;

analyzing at least accessing the first and second generated sets of alarms from in the alarm repository; determining to determine a current state of the service as a function of the accessed-first-and-second-alarms that originate from the subset of the plurality of network components; and

issuing generating one or more instructions to autonomously establish a desired <u>desirable</u> state of the service when the current state of the service is undesirable.

19. (Cancelled)

- 20. (Currently Amended) The method of claim 18, wherein the one or more issued instructions control an aspect of operation of one or more of the network components.
- 21. (Currently Amended) A computer program product comprising:

a computer readable medium having[[;]] computer program executable instructions

<u>recorded thereon</u> on the computer readable medium, wherein the computer <u>executable</u>

program instructions, when executed by a computer, directs the are operable to direct a

computer to perform a method of for providing service level management in a network,

wherein the network includes a plurality of network components, and wherein a service

operates on a subset of the plurality of network components, the service having a state, the

method comprising:

monitoring at least one aspect or more aspects of operation of one or more of the

network and components;

detecting one or more events relative to in the monitored aspect one or more aspects

of operation;

generating alarms an alarm for a respective aspect of network operation as a function

of the respective detected one or more events;

analyzing the generated determining an association between the one or more alarms

that originate from the subset of the plurality of network components and determining to

determine a current state of the service as a function of the association; and

issuing generating one or more instructions to autonomously establish a desired

<u>desirable</u> state of the service when the current state of the service is undesirable.

22. (Cancelled)

23. (Currently Amended) A computer-implemented system for providing service level

management in a network, wherein the network includes a plurality of network components,

and wherein a service operates on a subset of the plurality of components, the service having a

state, the system comprising:

multiple monitoring agents that [[to]] each monitor a respective aspect of operation of

one or more of the network components, wherein each monitoring agent detects one or more

events relative to in the respective aspect of operation and generates alarms generate an

alarm as a function of the one or more detected events[[;]], each monitoring agent including:

Page 9 of 15

each monitoring agent including an alarm correlation agent that receives the generated alarms in addition to one or more alarms generated by from the other monitoring agents for consideration in generating the alarm as a function of the one or more detected events, wherein the alarm correlation agent determines a current state of the service based on the received alarms; and

each monitoring agent including a control agent that issues one or more instructions regarding controls the respective monitored aspect of operation, wherein the control agent issues one or more instructions regarding the controlled aspect of operation of the network in order to autonomously establish a desired desirable state of the service when the current state of the service is undesirable.

24. (**Previously Presented**) The system of claim 23, wherein the monitoring agents comprise at least one of:

an infrastructure monitoring agent to monitor operation of the network infrastructure;

a computer system monitoring agent to monitor operation of at least one computer system on the network;

a network traffic monitoring agent to monitor traffic on the network;

an application monitoring agent to monitor operation of at least one application operating on the network;

a trouble-ticketing agent to receive reports of problems by users with respect to operation of the network;

a response time monitoring agent to monitor a response time of a communication on the network;

a device monitoring agent to monitor operation of a device on the network; and

a multicomponent monitoring agent comprising an aggregate of any of the above monitoring agents.

25. (**Currently Amended**) The system of claim 23, wherein the monitoring agents comprise reasoning agents, and wherein the reasoning agents comprise at least one of:

a rule-based reasoning agent;

a model-based reasoning agent;

a state-transition graph based reasoning agent;

a code book based reasoning agent; and

a case-based reasoning agent.

26. (Currently Amended) A computer program product comprising:

a computer readable medium having[[;]] computer program executable instructions, when executed by a computer, are operable to direct each of a plurality of agents the computer to perform a method for providing service level management in a network, wherein the network includes a plurality of network components, and wherein a service operates on a subset of the plurality of network components, the service having a state, the method comprising, for each of a plurality of agents;:

monitoring <u>at least</u> one or more aspects of the respective <u>aspect of</u> operation of <u>one or</u> <u>more of</u> the network and <u>components;</u>

detecting the one or more events relative to in the respective monitored one or more aspects aspect of operation;

generating an alarm for the respective aspect of network operation alarms as a function of the respective detected one or more events;

communicating with the other agents to access events or alarms in the other respective monitored aspects of operation of the other monitoring agent that originate from the subset of the plurality of network components, and;

analyzing at least the generated alarms and the accessed events or alarms to determine determining an existence of an association between these events or alarms from other monitoring agents in the alarm generated for the respective aspect of network operation and determining a current state of the service as a function of the association; and

<u>issuing generating</u> one or more instructions to autonomously establish a <u>desired</u> <u>desirable</u> state of the service when the current state of the service is undesirable.
